

Arming and disarming the alarm centre is one of the tasks that the owners have to take care of on a daily basis.

This task does not apply to AlarmTab® if you activate the **smartphone automatic switch** in the control panel.

Most people use a smartphone as their indispensable companion, at home and on the go. AlarmTab® uses this for an automatic switching of your alarm center by detecting whether you are moving away from the object.

If the last person with your smartphone leaves the house, AlarmTab® automatically activates and signals this on all smartphones with an acoustic tone and a switching message on the display. So everyone involved knows that their house is now automatically secured.

When the first person approaches the home, AlarmTab® automatically deactivates and briefly signals this on all smartphones.

Thanks to the automatic control, you no longer need to worry about switching your alarm system.

The beep on your smartphone has other advantages, such as knowing when your child has arrived home from school. or when the employees opened the store.

And a self triggered false alarm due to forgotten unsharp switching is a thing of the past. Also no clumsy remote controls have to be carried on the key ring.

Battery replacement and the risk of interception of radio signals by third parties are also eliminated. Modern technologies relieve the strain on people and protect reliably and free of charge.

Of course, the control panel can also be switched by hand using the traditional remote control and transponder chip and PIN code or smartphone app.
