

The best protection against burglars is **prevention**.

If the impression is created that the residents are awake, there is hardly ever a break-in. Because the perpetrators shy away from the confrontation with the inhabitants or their dog. This uses AlarmTab® and simulates in different ways that the residents are on site.

For example, a function that simulates the light of a television in the room is integrated in the control centre. In addition, the typical everyday sounds of an inhabited house can be played.

This deterrent function can be programmed at any time and activated when the control unit is armed. For the observer, this creates the impression that the inhabitants are there and awake.

In addition, **Smart-Home control** allows light, shutters, lawn sprinklers, alarm loudspeakers and each other electrical equipment, by time control or sensors.

Roller shutters

Light

If, for example, the outdoor motion detector is triggered, the control centre can shut down the roller shutters, switch on the lights or start the alarm loudspeaker with dogs barking. In this way, you can ensure that the perpetrators escape immediately without causing any damage.
