

Previously, alarm systems could only report a burglary, which is why these systems are called **burglar alarm systems** in specialist circles.

Imagine you are on holiday, at work or shopping in the next town and you receive a burglary report.

Doing what?

Go home as soon as possible to see for yourself?

Or call the police immediately?

Or hire a security guard and pay monthly fees for it?

What if it's just a false alarm, which can happen again and again with traditional burglar alarm systems?

The police will gladly send an invoice in the event of a false alarm.

Since the **perpetrators** have disappeared in **most cases after 3-5 minutes** with your loot again, any help usually comes too late. But the technology is already on site when there's a break-in.

Let technology do what people can't do in time. (No matter how much you hurry to get there) AlarmTab® not only protects with fast and clear messages, but also supports you with innovative functions such as **perpetrator distraction and reconnaissance program**.

The animation in the video shows you how this works.
